We stock these Locking Hub brands for the Ford F150 Dorman, Warn, Mile Marker and SKF. Same a bunch of money from what it would cost at the Ford dealer. I have used partsgeeks several times, the parts have always been the right ones, on time and good prices. I recommend them to everyone. I installed them and they worked great.I would recommend these to any one with a 78 thru 96 F150 or Ford Bronco. These manual locking hubs saved the day they are very well made I would recommend them before you run into trouble with the cheap clip on the automatic locking hub. Now we've expanded the line to include new Premium Locking Hubs for late model Ford Super Duty trucks—the first generation to feature WARN's aggressive new hub styling. Check out the chrome and black offerings and remember When it comes to hubs, Warn is the brand to trust. WARN Epic Wheels are packed full of the durability, performance, and style you expect from Warn Industries, and are designed for life offroad. These wheels fit your individual style and offer a perfect fit, no matter which Jeep you drive. Our hubs provide increased durability and fuel economy, and are easy to install. What else would you expect

from the company that invented the locking hub. He is in search of a conversion kit to put manual locking hubs on his front axle. I know Ford doesn't offer anything like this, and so far I have had no luck with the aftermarket

shops. <http://leeharringtonhomes.com/userfiles/business-financial-calculator-el-733a-manual.xml>

No real definitive search results online either. Has anyone got any info regarding a manufacturer that has this conversion kit, if it even exists? There is no conversion that I know of. If you develop one, you'll get plenty of interest. I used to go to Warn for replacement locking hubs. It would take a lot of fuel savings to pay for that. Please upgrade your browser to improve your experience. Fuel economy may improve as much as one mile per gallon, depending on the vehicle, by disconnecting the front wheels. A one mpg difference may not sound like much, but every little bit helps. The automatic locking hub does it automatically on the fly. The locking mechanism inside an automatic locking hub is sort of like a one-way clutch. When torque is applied by the driveshaft, it forces the hub to slide in and lock. When the driver shifts to two-wheel drive, the clutch mechanism inside the hub slides back out and releases the hub, allowing the wheel to turn independent of its axle shaft. Some of the older types require the vehicle to stop and back up a short distance to engage the locking mechanism. Some automatic locking hubs don't engage in reverse, and others use a vacuum diaphragm to engage the hub or the axle shaft when switching between two and four-wheel drive modes. With this setup, the hub on the opposite side remains locked and the axle continues to turn with the wheel. But as long as the transfer case remains in the 2WD mode, the front wheels are not driven. When the transfer case is shifted into 4WD, the unlocked hub automatically slides into position and locks the axle so both front wheels become drive wheels. This allows the hub to engage as needed or to remain in the locked position all the time. A locked differential is great for serious offroading because it keeps both front wheels turning regardless of traction. But, it can make a vehicle difficult to handle or steer when driving on dry or wet pavement, snow, loose dirt or sand.

Mud, rust or worn parts inside the hub can prevent the mechanism from sliding in and locking the hub. The driver may not notice anything is wrong until he finds himself stuck axle deep in mud and realizes the front wheels aren't doing anything. Or, he may hear some grinding noises when he shifts to four-wheel drive and may think something is wrong with the transfer case or front differential. Anything that binds the internal mechanism can prevent it from sliding and releasing. Put the transmission in park, set the parking brake and raise the chassis so one of the front wheels is off the ground while the other is still on the ground. When the transfer case is in two-wheel drive, the hubs should be released, allowing the wheels to turn freely when spun by hand. If the axle shaft turns when you spin the wheel, it means the hub has not disengaged. This should lock the hub. Try turning the wheel by hand again. The axle shaft should now turn with the wheel if the hub is locked. If the hub fails to lock, the hub will have to be disassembled and inspected or replaced. You should hear a click as the locking mechanism slides back out and disengages the hub. Rotate the wheel forward again and it should turn freely. Then start the engine and place the transfer case in four-wheel drive and the transmission in drive. If the front wheels don't turn, look at the front axle shafts. If both shafts are turning, but one wheel is not, the problem is a bad hub on the wheel that isn't turning. If the front driveshafts are not turning when the transfer case is in four-wheel drive, the problem is inside the differential: broken side gears or the transfer case broken chain, shift linkage, etc.. If the driveshaft between the transfer case and differential is turning, the problem is in the differential. If the driveshaft is not turning, the vehicle is going to need repairs to the transfer case. The outer hub cover is usually attached to the hub with five or six Torx screws.

Disassembly and reassembly procedures will vary from one hub design to another, so refer to the OEM service information for the specifics. If you don't have manual or online service information, disassemble one hub at a time. That way, if you can't remember how the parts came apart, you can

always refer to the other hub as a guide. This allows for computer assistance such as Adaptive Cruise Control, and Electronic Stability Control. However, a knowledge of the mechanical and electronic component operation is imperative to successfully diagnosing and fixing these systems. Press question mark to learn the rest of the keyboard shortcuts Log in sign up User account menu 3 EL15 Why do Ford trucks have manual hubs, but nobody elses do SuperDuty trucks are work trucks so they are often off road, plowing snow etc.if you were in 2WD and got stuck in a vacuum actuated system it would be near impossible to have those hubs lock in if they truck cant move. Ford recognized this and put the manual locking hubs on all trucks except the F150. Plus, if you had a vaccuum acuated system and that vaccuum fails then what.But it looks like auto locking hubs is a vacuum actuated addon feature and not standard package. So if you bought a base model.then that explains that.

<https://difumarket.com/images/3m-x30-user-manual.pdf>

Also seems even with the auto feature in the console, the manual lock is still retained if you need to. And since auto lock requires the wheel to spin before locking, manual override may be needed if youre binded stuck. Or yet auto vacuum system is damaged. We have a 4WD F550 with selector knob at my ambulance service, and no manual hubs, so must be vacuum activated as one would hope an ambulance would be so were not wasting time flipping hubs with a critical patient in the snow or sand. Follow up question what happens if you select 4x4 and dont flip the hubs. Presumably something bad, but what exactly. This means that theres extra driveline resistance, so less MPG. They actually make conversion hubs so you can retrofit manual locking hubs to these trucks for an MPG increase. They are manual rather than auto locking hubs, because manual are much more reliable, and you can engage them while stopped. The front and rear wheels have to be spinning the same speed to engage auto locking hubs, so if you are stuck in the snow, the front wheels wont be spinning and cant engage. All rights reserved Back to top. The auto hubs lock up by vacuum, with my F350 all vacuum lines did not have any leak but the HUB. Ford F150 For Sale The Car Connection Jan 05, 2011 There is a company that makes a kit that replaces the vacuum actuator for the center axle disconnect and converts it to a manual, cable style, but I havent found a source for standard style wheel bearings and manual locking hubs.It was a perfect fit and the video installation was a great help!!
